## A-level CHEMISTRY

## Paper 2 Organic and Physical Chemistry

## Monday 8 June 2020

Afternoon
Time allowed: 2 hours

## Materials

For this paper you must have:

- the Periodic Table/Data Booklet, provided as an insert (enclosed)
- a ruler with millimetre measurements
- a scientific calculator, which you are expected to use where appropriate.

## Instructions

- Use black ink or black ball-point pen.
- Fill in the boxes at the top of this page.
- Answer all questions.
- You must answer the questions in the spaces provided. Do not write outside the box around each page or on blank pages.
- If you need extra space for your answer(s), use the lined pages at the end of this book. Write the question number against your answer(s).
- All working must be shown.
- Do all rough work in this book. Cross through any work you do not want to be marked.

| :--- | :--- | This question is about rates of reaction.

Phosphinate ions $\left(\mathrm{H}_{2} \mathrm{PO}_{2}^{-}\right)$react with hydroxide ions to produce hydrogen gas as shown.

$$
\mathrm{H}_{2} \mathrm{PO}_{2}^{-}+\mathrm{OH}^{-} \rightarrow \mathrm{HPO}_{3}{ }^{2-}+\mathrm{H}_{2}
$$

A student completed an experiment to determine the initial rate of this reaction.
The student used a solution containing phosphinate ions and measured the volume of hydrogen gas collected every 20 seconds at a constant temperature.
Figure 1 shows a graph of the student's results.

Isomer G

Isomer $\mathbf{F}$ is the active compound in the medicine ibuprofen.
In the manufacture of ibuprofen both isomers $\mathbf{F}$ and $\mathbf{G}$ are formed. An enzyme is then used to bind to isomer $\mathbf{G}$ and catalyse its hydrolysis.

After the products of hydrolysis of $\mathbf{G}$ are removed, a pure sample of isomer $\mathbf{F}$ is collected.

Explain how a structural feature of this enzyme enables it to catalyse the hydrolysis of isomer $\mathbf{G}$ but not the hydrolysis of isomer $\mathbf{F}$.
