Pearson Edexcel GCE in Core Mathematics 4 (6666/01)

Edexcel and BTEC Qualifications

Edexcel and BTEC qualifications are awarded by Pearson, the UK's largest awarding body. We provide a wide range of qualifications including academic, vocational, occupational and specific programmes for employers. For further information visit our qualifications websites at www.edexcel.com or www.btec.co.uk. Alternatively, you can get in touch with us using the details on our contact us page at www.edexcel.com/contactus.

Pearson: helping people progress, everywhere

Pearson aspires to be the world's leading learning company. Our aim is to help everyone progress in their lives through education. We believe in every kind of learning, for all kinds of people, wherever they are in the world. We've been involved in education for over 150 years, and by working across 70 countries, in 100 languages, we have built an international reputation for our commitment to high standards and raising achievement through innovation in education. General Marking Guidance

- All candidates must receive the same treatment. Examiners must mark the first candidate in exactly the same way as they mark the last.
- Mark schemes should be applied positively. Candidates must be rewarded for what they have shown they can do rather than penalised for omissions.
- Examiners should mark according to the mark scheme not according to their perception of where the grade boundaries may lie.
- There is no ceiling on achievement. All marks on the mark scheme should be used appropriately.
- All the marks on the mark scheme are designed to be awarded. Examiners should always award full marks if deserved, i.e. if the answer matches the mark scheme. Examiners should also be prepared to award zero marks if the candidate's response is not worthy of credit according to the mark scheme.
- Where some judgement is required, mark schemes will provide the principles by which marks will be awarded and exemplification may be limited.
- Crossed out work should be marked UNLESS the candidate has replaced it with an alternative response.

EDEXCEL GCE MATHEMATICS

General Instructions for Marking

- 1. The total number of marks for the paper is 75.
- 2. The Edexcel Mathematics mark schemes use the following types of marks:
- **M** marks: method marks are awarded for 'knowing a method and attempting to apply it', unless otherwise indicated.
- A marks: Accuracy marks can only be awarded if the relevant method (M) marks have been earned.
- **B** marks are unconditional accuracy marks (independent of M marks)
- Marks should not be subdivided.
- 3. Abbreviations

These are some of the traditional marking abbreviations that will appear in the mark schemes.

- bod benefit of doubt
- ft follow through
- the symbol $\sqrt{}$ will be used for correct ft
- cao correct answer only
- cso correct solution only. There must be no errors in this part of the question to obtain this mark
- isw ignore subsequent working
- awrt answers which round to
- SC: special case
- oe or equivalent (and appropriate)
- dep dependent
- indep independent
- dp decimal places
- sf significant figures
- * The answer is printed on the paper
- The second mark is dependent on gaining the first mark
- dM1 denotes a method mark which is dependent upon the award of the previous method mark.
- 4. All A marks are 'correct answer only' (cao.), unless shown, for example, as A1 ft to indicate that previous wrong working is to be followed through. After a misread however, the subsequent A marks affected are treated as A ft, but manifestly absurd answers should never be awarded A marks.
- 5. For misreading which does not alter the character of a question or materially simplify it, deduct two from any A or B marks gained, in that part of the question affected.

- 6. If a candidate makes more than one attempt at any question:
 - If all but one attempt is crossed out, mark the attempt which is NOT crossed out.
 - If either all attempts are crossed out or none are crossed out, mark all the attempts and score the highest single attempt.
- 7. Ignore wrong working or incorrect statements following a correct answer.

General Principles for Core Mathematics Marking

(But note that specific mark schemes may sometimes override these general principles).

Method mark for solving 3 term quadratic:

1. Factorisation

$$(x^2 + bx + c) = (x + p)(x + q)$$
, where $|pq| = |c|$, leading to $x = ...$

$$(ax^2 + bx + c) = (mx + p)(nx + q)$$
, where $|pq| = |c|$ and $|mn| = |a|$, leading to $x = ...$

2. Formula

Attempt to use the correct formula (with values for a, b and c).

3. Completing the square

Solving
$$x^2 + bx + c = 0$$
: $\left(x \pm \frac{b}{2}\right)^2 \pm q \pm c = 0$, $q \neq 0$, leading to $x = \dots$

Method marks for differentiation and integration:

1. Differentiation

Power of at least one term decreased by 1. $(x^n \rightarrow x^{n-1})$

2. Integration

Power of at least one term increased by 1. $(x^n \rightarrow x^{n+1})$

Use of a formula

Where a method involves using a formula that has been learnt, the advice given in recent examiners' reports is that the formula should be quoted first.

Normal marking procedure is as follows:

<u>Method mark</u> for quoting a correct formula and attempting to use it, even if there are small errors in the substitution of values.

Where the formula is <u>not</u> quoted, the method mark can be gained by implication from <u>correct</u> working with values, but may be lost if there is any mistake in the working.

Exact answers

Examiners' reports have emphasised that where, for example, an exact answer is asked for, or working with surds is clearly required, marks will normally be lost if the candidate resorts to using rounded decimals.

		Question 1 Notes	
1. (a)	B1	$(4)^{\frac{1}{2}}$ or 2 outside brackets or 2 as candidate's constant term in their binomial expansion	1.
	M1	Expands $(+kx)^{\frac{1}{2}}$ to give any 2 terms out of 3 terms simplified or un-simplified,	
		Eg: $1 + \left(\frac{1}{2}\right)(kx)$ or $\left(\frac{1}{2}\right)(kx) + \frac{\left(\frac{1}{2}\right)\left(-\frac{1}{2}\right)}{2!}(kx)^2$ or $1 + \dots + \frac{\left(\frac{1}{2}\right)\left(-\frac{1}{2}\right)}{2!}(kx)^2$	
		where k is a numerical value and where $k \neq 1$.	
	A1	A correct simplified or un-simplified $1 + \left(\frac{1}{2}\right)(kx) + \frac{\left(\frac{1}{2}\right)(-\frac{1}{2})}{2!}(kx)^2$ expansion with consist	stent (kx).
	Note	(kx) , $k \ne 1$, must be consistent (on the RHS, not necessarily on the LHS) in a candidate	's expansion.

1. (a) ctd.	Note	Award B1M1A0 for $2\left[1+\left(\frac{1}{2}\right)\left(5x\right)+\frac{\left(\frac{1}{2}\right)\left(-\frac{1}{2}\right)}{2!}\left(\frac{5x}{4}\right)^2+\dots\right]$ because (kx) is not consistent.			
	Note	Incorrect bracketing: $2\left[1+\left(\frac{1}{2}\right)\left(\frac{5x}{4}\right)+\frac{\left(\frac{1}{2}\right)\left(-\frac{1}{2}\right)}{2!}\left(\frac{5x^2}{4}\right)+\dots\right]$ is B1M1A0 unless recovered.			
	A1	$2 + \frac{5}{4}x$ (simplified fractions) or allow $2 + 1.25x$ or $2 + 1\frac{1}{4}x$			
	A1	Accept only $-\frac{25}{64}x^2$ or $-0.390625x^2$			
	SC	f a candidate would otherwise score 2 nd A0, 3 rd A0 then allow Special Case 2 nd A1 for either			
		SC: $2\left[1+\frac{5}{8}x;\right]$ or SC: $2\left[1+\frac{25}{128}x^2+\right]$ or SC: $\lambda\left[1+\frac{5}{8}x-\frac{25}{128}x^2+\right]$			
		or SC: $\left[\lambda + \frac{5\lambda}{8}x - \frac{25\lambda}{128}x^2 +\right]$ (where λ can be 1 or omitted), where each term in the $\left[\right]$			
		is a simplified fraction or a decimal,			
		OR SC: for $2 + \frac{10}{8}x - \frac{50}{128}x^2 + \dots$ (i.e. for not simplifying their correct coefficients.)			
	Note	Candidates who write $2\left[1+\left(\frac{1}{2}\right)\left(-\frac{5x}{4}\right)+\frac{\left(\frac{1}{2}\right)\left(-\frac{1}{2}\right)}{2!}\left(-\frac{5x}{4}\right)^2+\dots\right]$, where $k=-\frac{5}{4}$ and not $\frac{5}{4}$			
		and achieve $2 - \frac{5}{4}x - \frac{25}{64}x^2 +$ will get B1M1A1A0A1			
	Note	Ignore extra terms beyond the term in x^2 .			
	Note	You can ignore subsequent working following a correct answer.			
(b)	B1	$\frac{3}{2}\sqrt{2} \text{ or } 1.5\sqrt{2} \text{ or } k = \frac{3}{2} \text{ or } 1.5 \text{ o.e. (Ignore how } k = \frac{3}{2} \text{ is found.)}$			
(c)	M1	Substitutes $x = \frac{1}{10}$ or 0.1 into their binomial expansion found in part (a) which must contain both			
		an x term and an x^2 term (or even an x^3 term) and equates this to either $\frac{3}{\sqrt{2}}$ or their $k\sqrt{2}$ from (b),			
		where k is a numerical value.			
	Note	M1 can be implied by $\frac{3}{2}\sqrt{2}$ or $1.5\sqrt{2}$ or $\frac{3}{\sqrt{2}}$ = awrt 2.121			
	Note	M1 <i>can be implied</i> by $\frac{1}{k}$ (their $\frac{543}{256}$), with their k found in part (b).			
	Note	M1 <i>cannot be implied</i> by (k) (their $\frac{543}{256}$), with their k found in part (b).			
	A1	$\frac{181}{128}$ or any equivalent fraction, eg: $\frac{362}{256}$ or $\frac{543}{384}$. Also allow $\frac{256}{181}$ or any equivalent fraction.			
	Note	Also allow A1 for $p = 181$, $q = 128$ or $p = 181\lambda$, $q = 128\lambda$			
		or $p = 256$, $q = 181$ or $p = 256\lambda$, $q = 181\lambda$, where $\lambda \in \mathbb{Z}^+$			
	Note Note Note	You can recover work for part (c) in part (b). You cannot recover part (b) work in part (c). Candidates are allowed to restart and gain all 2 marks in part (c) from an incorrect part (b). Award M1 A1 for the correct answer from no working.			

1. (a) Alternative methods for part (a) Alternative method 1: Candidates can apply an alternative form of the binomial expansion. $\left((4+5x)^{\frac{1}{2}}\right) = (4)^{\frac{1}{2}} + \left(\frac{1}{2}\right)(4)^{-\frac{1}{2}}(5x) + \frac{\left(\frac{1}{2}\right)(-\frac{1}{2})}{2!}(4)^{-\frac{3}{2}}(5x)^2$ $(4)^{\frac{1}{2}}$ or 2 **B1 M1** Any two of three (un-simplified) terms correct. All three (un-simplified) terms correct. **A1** $2 + \frac{5}{4}x$ (simplified fractions) or allow 2 + 1.25x or $2 + 1\frac{1}{4}x$ **A1** Accept only $-\frac{25}{64}x^2$ or $-0.390625x^2$ **A1** Note The terms in C need to be evaluated. So $\frac{1}{2}C_0(4)^{\frac{1}{2}} + \frac{1}{2}C_1(4)^{-\frac{1}{2}}(5x); + \frac{1}{2}C_2(4)^{-\frac{3}{2}}(5x)^2$ without further working is B0M0A0. Alternative Method 2: Maclaurin Expansion $f(x) = (4 + 5x)^{\frac{1}{2}}$ $f''(x) = -\frac{25}{4}(4+5x)^{-\frac{3}{2}}$ $f'(x) = \frac{1}{2}(4+5x)^{-\frac{1}{2}}(5)$ A1 oe $\left\{ :: f(0) = 2, f'(0) = \frac{5}{4} \text{ and } f''(0) = -\frac{25}{32} \right\}$ So, $f(x) = 2 + \frac{5}{4}x$; $-\frac{25}{64}x^2 + ...$ A1; A1

2. (a) General	Note	Writing down $\frac{dy}{dx} = \frac{2x - 3y}{3x + 8y}$ or $\frac{3y - 2x}{-3x - 8y}$ from no working is full marks	
	Note	Writing down $\frac{dy}{dx} = \frac{2x - 3y}{-3x - 8y}$ or $\frac{3y - 2x}{3x + 8y}$ from no working is M1A0B1M1A0	
	Note	Few candidates will write $2x dx - 3y dx - 3x dy - 8y dy = 0$ leading to $\frac{dy}{dx} = \frac{2x - 3y}{3x + 8y}$, o.e.	
		This should get full marks.	

2. (a)	M1	Differentiates implicitly to include either $\pm 3x \frac{dy}{dx}$ or $-4y^2 \rightarrow \pm ky \frac{dy}{dx}$. (Ignore $\left(\frac{dy}{dx} = \right)$).					
	A1	Both $x^2 \to 2x$ and $-4y^2 + 64 = 0 \to -8y \frac{dy}{dx} = 0$					
	Note	If an extra term appears then award A0.					
	M1	$-3xy \rightarrow -3x\frac{dy}{dx} - 3y$ or $-3x\frac{dy}{dx} + 3y$ or $3x\frac{dy}{dx} - 3y$ or $3x\frac{dy}{dx} + 3y$					
	Note	$2x - 3y - 3x \frac{dy}{dx} - 8y \frac{dy}{dx} \rightarrow 2x - 3y = 3x \frac{dy}{dx} + 8y \frac{dy}{dx}$					
		will get 1^{st} A1 (implied) as the "=0" can be implied by the rearrangement of their equation.					
	dM1	dependent on the FIRST method mark being awarded.					
		An attempt to factorise out all the terms in $\frac{dy}{dx}$ as long as there are at least two terms in $\frac{dy}{dx}$.					
		i.e + $(-3x - 8y)\frac{dy}{dx}$ = or = $(3x + 8y)\frac{dy}{dx}$. (Allow combining in 1 variable).					
	A1	$\frac{2x-3y}{3x+8y}$ or $\frac{3y-2x}{-3x-8y}$ or equivalent.					
	Note Note	cso If the candidate's solution is not completely correct, then do not give this mark. You cannot recover work for part (a) in part (b).					
2. (b)	M1	Sets their numerator of their $\frac{dy}{dx}$ equal to zero (or the denominator of their $\frac{dx}{dy}$ equal to zero) o.e.					
	Note	st M1 can also be gained by setting $\frac{dy}{dx}$ equal to zero in their " $2x - 3y - 3x \frac{dy}{dx} - 8y \frac{dy}{dx} = 0$ "					
	Note	If their numerator involves one variable only then only the 1st M1 mark is possible in part (b).					
	Note	If their numerator is a constant then no marks are available in part (b)					
	Note	If their numerator is in the form $\pm ax^2 \pm by = 0$ or $\pm ax \pm by^2 = 0$ then the first 3 marks are					
		possible in part (b).					
	Note	$\frac{dy}{dx} = \frac{2x - 3y}{3x + 8y} = 0 \text{ is not sufficient for M1.}$					
	A1ft	Either					
		• Sets $2x - 3y$ to zero and obtains either $y = \frac{2}{3}x$ or $x = \frac{3}{2}y$					
		• the follow through result of making either y or x the subject from setting their numerator					
		of their $\frac{dy}{dx}$ equal to zero					
	dM1	dependent on the first method mark being awarded.					
		Substitutes <i>either</i> their $y = \frac{2}{3}x$ or their $x = \frac{3}{2}y$ into the original equation to give an equation in					
		one variable only.					
	A1	Obtains either $x = \frac{24}{5}$ or $-\frac{24}{5}$ or $y = \frac{16}{5}$ or $-\frac{16}{5}$, (or equivalent) by correct solution only.					
		i.e. You can allow for example $x = \frac{48}{10}$ or 4.8, etc.					
	Note	$x = \sqrt{\frac{576}{25}}$ (not simplified) or $y = \sqrt{\frac{256}{25}}$ (not simplified) is not sufficient for A1.					

2. (b)	ddM1	dependent on both previous method marks being awarded in this part.
ctd		Method 1
		Either:
		• substitutes their x into their $y = \frac{2}{3}x$ or substitutes their y into their $x = \frac{3}{2}y$, or
		• substitutes <i>the other of</i> their $y = \frac{2}{3}x$ or their $x = \frac{3}{2}y$ into the original equation,
		and achieves either:
		 exactly two sets of two coordinates or
		• exactly two distinct values for x and exactly two distinct values for y.
		Method 2
		Either:
		• substitutes their first x-value, x_1 into $x^2 - 3xy - 4y^2 + 64 = 0$ to obtain one y-value, y_1 and
		substitutes their second x-value, x_2 into $x^2 - 3xy - 4y^2 + 64 = 0$ to obtain 1 y-value y_2 or
		• substitutes their first y-value, y_1 into $x^2 - 3xy - 4y^2 + 64 = 0$ to obtain one x-value x_1 and
		substitutes their second y-value, y_2 into $x^2 - 3xy - 4y^2 + 64 = 0$ to obtain one x-value x_2 .
	Note	Three or more sets of coordinates given (without identification of two sets of coordinates) is ddM0.
	A1	Both $\left(\frac{24}{5}, \frac{16}{5}\right)$ and $\left(-\frac{24}{5}, -\frac{16}{5}\right)$, only by cso. Note that decimal equivalents are fine.
	Note	Also allow $x = \frac{24}{5}$, $y = \frac{16}{5}$ and $x = -\frac{24}{5}$, $y = -\frac{16}{5}$ all seen in their working to part (b).
	Note	Allow $x = \pm \frac{24}{5}$, $y = \pm \frac{16}{5}$ for 3 rd A1.
	Note	$x = \pm \frac{24}{5}$, $y = \pm \frac{16}{5}$ followed by eg. $\left(\frac{16}{5}, \frac{24}{5}\right)$ and $\left(-\frac{16}{5}, -\frac{24}{5}\right)$
	Note	(eg. coordinates stated the wrong way round) is 3 rd A0. It is possible for a candidate who does not achieve full marks in part (a), (but has a correct numerator
		for $\frac{dy}{dx}$) to gain all 6 marks in part (b).
	Note	Decimal equivalents to fractions are fine in part (b). i.e. $(4.8, 3.2)$ and $(-4.8, -3.2)$.
	Note	$\left(\frac{24}{5}, \frac{16}{5}\right)$ and $\left(-\frac{24}{5}, -\frac{16}{5}\right)$ from no working is M0A0M0A0M0A0.
	Note	Candidates could potentially lose the final 2 marks for setting both their numerator and denominator to zero.
	Note	No credit in this part can be gained by only setting the denominator to zero.

		Question 3 Notes	
3. (a)	M1	Attempts to solve $e^{\frac{1}{2}x} = 4$ giving $x =$ in terms of $\pm \lambda \ln \mu$ where $\mu > 0$	
(b)	A1 NOT	4ln 2 cao stated in part (a) only (Ignore $x = 0$) Part (b) appears as M1M1A1 on ePEN, but is now marked as M1A1A1.	
(b)	E		
	M1	Integration by parts is applied in the form $\alpha x e^{\frac{1}{2}x} - \beta \int e^{\frac{1}{2}x} \{dx\}$, where $\alpha > 0$, $\beta > 0$.	
		(must be in this form) with or without dx	
	A1	$2xe^{\frac{1}{2}x} - \int 2e^{\frac{1}{2}x} \{dx\}$ or equivalent, with or without dx. Can be un-simplified.	
	A1	$2xe^{\frac{1}{2}x} - 4e^{\frac{1}{2}x}$ or equivalent with or without + c. Can be un-simplified.	
	Note	You can also allow $2e^{\frac{1}{2}x}(x-2)$ or $e^{\frac{1}{2}x}(2x-4)$ for the final A1.	
	isw	You can ignore subsequent working following on from a correct solution.	
	SC	SPECIAL CASE: A candidate who uses $u = x$, $\frac{dv}{dx} = e^{\frac{1}{2}x}$, writes down the correct "	by parts"
		formula, but makes only one error when applying it can be awarded Special Case M1 (Applying their ν counts for one consistent error.)	

3. (c)	B1	$4x \rightarrow 2x^2 \text{ or } \frac{4x^2}{2} \text{ oe}$	
	M1	Complete method of applying limits of their x_A and 0 to all terms of an expression of the form	
		$\pm Ax^2 \pm Bxe^{\frac{1}{2}x} \pm Ce^{\frac{1}{2}x}$ (where $A \neq 0$, $B \neq 0$ and $C \neq 0$) and subtracting the correct way round.	
	NI-4-		
	Note	Evidence of a proper consideration of the limit of 0 is needed for M1. So subtracting 0 is M0.	
	Note	ln16 or 2ln4 or equivalent is fine as an upper limit.	
	A1	A correct three term exact quadratic expression in ln 2.	
		For example allow for A1	
		• $32(\ln 2)^2 - 32(\ln 2) + 12$	
		• $8(2\ln 2)^2 - 8(4\ln 2) + 12$	
		• $2(4 \ln 2)^2 - 32(\ln 2) + 12$	
		• $2(4\ln 2)^2 - 2(4\ln 2)e^{\frac{1}{2}(4\ln 2)} + 12$	
	Note	Note that the constant term of 12 needs to be combined from $4e^{\frac{1}{2}(4\ln 2)} - 4e^{\frac{1}{2}(0)}$ o.e.	
	Note	Also allow $32 \ln 2(\ln 2 - 1) + 12$ or $32 \ln 2 \left(\ln 2 - 1 + \frac{12}{32 \ln 2} \right)$ for A1.	
	Note	Do not apply "ignore subsequent working" for incorrect simplification.	
		Eg: $32(\ln 2)^2 - 32(\ln 2) + 12 \rightarrow 64(\ln 2) - 32(\ln 2) + 12$ or $32(\ln 4) - 32(\ln 2) + 12$	
	Note	Bracketing error: $32 \ln 2^2 - 32(\ln 2) + 12$, unless recovered is final A0.	
	Note	Notation: Allow $32(\ln^2 2) - 32(\ln 2) + 12$ for the final A1.	
	Note	5.19378 without seeing $32(\ln 2)^2 - 32(\ln 2) + 12$ is A0.	
	Note	5.19378 following from a correct $2x^2 - \left(2xe^{\frac{1}{2}x} - 4e^{\frac{1}{2}x}\right)$ is M1A0.	
	Note	5.19378 from no working is M0A0.

6. (a)	B1	$\frac{dx}{d\theta} = 2\cos\theta$. Also allow $dx = 2\cos\theta d\theta$. This mark can be implied by later working.	
	Note	You can give B1 for $2\cos\theta$ used correctly in their working.	
M 1		Substitutes $x = 1 + 2\sin\theta$ and their dx (from their rearranged $\frac{dx}{d\theta}$) into $\sqrt{(3-x)(x+1)} dx$.	
	Note Note	Condone bracketing errors here. $dx \neq \lambda d\theta$. For example $dx \neq d\theta$.	
	Note	Condone substituting $dx = \cos\theta$ for the 1 st M1 after a correct $\frac{dx}{d\theta} = 2\cos\theta$ or $dx = 2\cos\theta d\theta$	
	M1	Applies either • $1 - \sin^2 \theta = \cos^2 \theta$ • $\lambda - \lambda \sin^2 \theta$ or $\lambda (1 - \sin^2 \theta) = \lambda \cos^2 \theta$ • $4 - 4\sin^2 \theta = 4 + 2\cos 2\theta - 2 = 2 + 2\cos 2\theta = 4\cos^2 \theta$	
		to their expression where λ is a numerical value.	
	A1	Correctly proves that $\int \sqrt{(3-x)(x+1)} dx$ is equal to $4\int \cos^2 \theta d\theta$ or $\int 4\cos^2 \theta d\theta$	
	Note Note	All three previous marks must have been awarded before A1 can be awarded. Their final answer must include $d\theta$.	
	Note B1	You can ignore limits for the final A1 mark.	
Evidence of a correct equation in sint of sin o for some variety			
		• $0 = 1 + 2\sin\theta$ or $-1 = 2\sin\theta$ or $\sin\theta = -\frac{1}{2}$ which then leads to $\theta = -\frac{\pi}{6}$, and	
		• $3 = 1 + 2\sin\theta$ or $2 = 2\sin\theta$ or $\sin\theta = 1$ which then leads to $\theta = \frac{\pi}{2}$	
Note Allow B1 for $x = 1 + 2\sin\left(-\frac{\pi}{6}\right) = 0$ and $x = 1 + 2\sin\left(\frac{\pi}{2}\right) = 3$		Allow B1 for $x = 1 + 2\sin\left(-\frac{\pi}{6}\right) = 0$ and $x = 1 + 2\sin\left(\frac{\pi}{2}\right) = 3$	
	Note	Allow B1 for $\sin \theta = \left(\frac{x-1}{2}\right)$ or $\theta = \sin^{-1}\left(\frac{x-1}{2}\right)$ followed by $x = 0$, $\theta = -\frac{\pi}{6}$; $x = 3$, $\theta = \frac{\pi}{2}$	
(b)	(b) NOTE Part (b) appears as M1A1A1 on ePEN, but is now marked as M1M1A1.		
	M1	Writes down a correct equation involving $\cos 2\theta$ and $\cos^2 \theta$	
	Eg: $\cos 2\theta = 2\cos^2 \theta - 1$ or $\cos^2 \theta = \frac{1 + \cos 2\theta}{2}$ or $\lambda \cos^2 \theta = \lambda \left(\frac{1 + \cos 2\theta}{2}\right)$		
	and applies it to their integral. Note: Allow M1 for a correctly stated formula (via an		
	М1	incorrect rearrangement) being applied to their integral.	
	 M1 Integrates to give an expression of the form ±αθ ± βsin 2θ or k(±αθ ± βsin 2θ), α = (can be simplified or un-simplified). A1 A correct solution in part (b) leading to a "two term" exact answer. 		
		Eg: $\frac{4\pi}{3} + \frac{\sqrt{3}}{2}$ or $\frac{8\pi}{6} + \frac{\sqrt{3}}{2}$ or $\frac{1}{6} (8\pi + 3\sqrt{3})$	
	Note	5.054815 from no working is M0M0A0.	
	Note	Candidates can work in terms of k (note that k is not given in (a)) for the M1M1 marks in part (b).	
	Note	If they incorrectly obtain $4\int_{-\frac{\pi}{6}}^{\frac{\pi}{2}} \cos^2\theta d\theta$ in part (a) (or guess $k=4$) then the final A1 is available	
		for a correct solution in part (b) only.

	Question 8 Notes		
8. (a)	$\int dx$		
	M1	Substitutes either $x = 2$ or $y = 9$ into their $\frac{dy}{dx}$ which is a function of x or y to find m_T and	
		• either applies $y - 9 = (\text{their } m_T)(x - 2)$, where m_T is a numerical value.	
		• or applies $y = (\text{their } m_T)x + \text{their } c$, where m_T is a numerical value and c is found	
		by solving $9 = (\text{their } m_T)(2) + c$	
	Note	The first M1 mark can be implied from later working.	
	M1	Sets $y = 0$ in their <i>tangent</i> equation, where m_T is a numerical value, (seen or implied)	
		and progresses to $x = \dots$	
	A1	An exact value of $2 - \frac{1}{\ln 3}$ or $\frac{2\ln 3 - 1}{\ln 3}$ or $\frac{\ln 9 - 1}{\ln 3}$ by a correct solution only.	
	Note	Allow A1 for $2 - \frac{\lambda}{\lambda \ln 3}$ or $\frac{\lambda(2\ln 3 - 1)}{\lambda \ln 3}$ or $\frac{\lambda(\ln 9 - 1)}{\lambda \ln 3}$ or $2 - \frac{\lambda}{\lambda \ln 3}$, where λ is an integer, and ignore subsequent working.	
	Note	Using a changed gradient (i.e. applying $\frac{-1}{\text{their } \frac{dy}{dx}}$ or $\frac{1}{\text{their } \frac{dy}{dx}}$) is M0 M0 in part (a).	
Note Candidates who invent a value for m_T (where m_T)		Candidates who invent a value for m_T (which bears no resemblance to their gradient function)	
		cannot gain the 1 st M1 and 2 nd M1 mark in part (a).	
Q (b)	Note	A decimal answer of 1.089760773 (without a correct exact answer) is A0.	
8. (b)	B1	A correct expression for the volume with or without dx	
	Note	Eg: Allow B1 for $\pi \int (3^x)^2 \{dx\}$ or $\pi \int 3^{2x} \{dx\}$ or $\pi \int 9^x \{dx\}$ or $\pi \int (e^{x \ln 3})^2 \{dx\}$	
		or $\pi \int (e^{2x \ln 3}) \{dx\}$ or $\pi \int e^{x \ln 9} \{dx\}$ with or without dx	
	M1	Either $3^{2x} \rightarrow \frac{3^{2x}}{\pm \alpha (\ln 3)}$ or $\pm \alpha (\ln 3)3^{2x}$ or $9^x \rightarrow \frac{9^x}{\pm \alpha (\ln 9)}$ or $\pm \alpha (\ln 9)9^x$	
		$e^{2x\ln 3} \to \frac{e^{2x\ln 3}}{\pm \alpha(\ln 3)} \text{ or } \pm \alpha(\ln 3)e^{2x\ln 3} \text{ or } e^{x\ln 9} \to \frac{e^{x\ln 9}}{\pm \alpha(\ln 9)} \text{ or } \pm \alpha(\ln 9)e^{x\ln 9}, \text{ etc where } \alpha \in $	
	Note	$3^{2x} \rightarrow \frac{3^{2x+1}}{\pm \alpha (\ln 3)}$ or $9^x \rightarrow \frac{9^{x+1}}{\pm \alpha (\ln 3)}$ are allowed for M1	
	Note	$3^{2x} \to \frac{3^{2x+1}}{2x+1}$ or $9^x \to \frac{9^{x+1}}{x+1}$ are both M0	
	Note	M1 can be given for $9^{2x} \rightarrow \frac{9^{2x}}{\pm \alpha (\ln 9)}$ or $\pm \alpha (\ln 9)9^{2x}$	
	A1	Correct integration of 3^{2x} . Eg: $3^{2x} o \frac{3^{2x}}{2\ln 3}$ or $\frac{3^{2x}}{\ln 9}$ or $9^x o \frac{9^x}{\ln 9}$ or $e^{2x\ln 3} o \frac{1}{2\ln 3} \left(e^{2x\ln 3}\right)$	
	dM1	dependent on the previous method mark being awarded.	
	Note	Attempts to apply $x = 2$ and $x = 0$ to integrated expression and subtracts the correct way round.	
	note	Evidence of a proper consideration of the limit of 0 is needed for M1. So subtracting 0 is M0.
