

Monday 23 June 2014 – Morning

GCSE TWENTY FIRST CENTURY SCIENCE PHYSICS A/FURTHER ADDITIONAL SCIENCE A

A183/01 Module P7 (Foundation Tier)

Candidates answer on the Question Paper. A calculator may be used for this paper.

OCR supplied materials:

None

Other materials required:

- Pencil
- Ruler (cm/mm)

Duration: 1 hour

Candidate forename				Candidate surname			
Centre numb	er			Candidate nu	umber		

INSTRUCTIONS TO CANDIDATES

- Write your name, centre number and candidate number in the boxes above. Please write clearly and in capital letters.
- Use black ink. HB pencil may be used for graphs and diagrams only.
- Answer all the questions.
- Read each question carefully. Make sure you know what you have to do before starting your answer.
- Write your answer to each question in the space provided. Additional paper may be used if necessary but you must clearly show your candidate number, centre number and question number(s).
- Do **not** write in the bar codes.

INFORMATION FOR CANDIDATES

- The quality of written communication is assessed in questions marked with a pencil ().
- A list of useful relationships is printed on pages 2 and 3.
- The number of marks is given in brackets [] at the end of each question or part question.
- The total number of marks for this paper is 60.
- This document consists of 16 pages. Any blank pages are indicated.

TWENTY FIRST CENTURY SCIENCE EQUATIONS

Useful relationships

The Earth in the Universe

Sustainable energy

energy transferred = power
$$\times$$
 time
power = voltage \times current
efficiency = $\frac{\text{energy usefully transferred}}{\text{total energy supplied}} \times 100\%$

Explaining motion

$$speed = \frac{distance\ travelled}{time\ taken}$$

$$acceleration = \frac{change\ in\ velocity}{time\ taken}$$

$$momentum = mass\ \times\ velocity$$

$$change\ of\ momentum\ =\ resultant\ force\ \times\ time\ for\ which\ it\ acts$$

$$work\ done\ by\ a\ force\ =\ force\ \times\ distance\ moved\ in\ the\ direction\ of\ the\ force$$

$$amount\ of\ energy\ transferred\ =\ work\ done$$

$$change\ in\ gravitational\ potential\ energy\ =\ weight\ \times\ vertical\ height\ difference$$

$$kinetic\ energy\ =\ \frac{1}{2}\ \times\ mass\ \times\ [velocity]^2$$

Electric circuits

power = voltage × current

resistance =
$$\frac{\text{voltage}}{\text{current}}$$
 $\frac{\text{voltage across primary coil}}{\text{voltage across secondary coil}} = \frac{\text{number of turns in primary coil}}{\text{number of turns in secondary coil}}$

Radioactive materials

```
energy = mass \times [speed of light in a vacuum]<sup>2</sup>
```

Observing the Universe

lens power =
$$\frac{1}{\text{focal length}}$$

$$magnification = \frac{focal length of objective lens}{focal length of eyepiece lens}$$

speed of recession = Hubble constant \times distance

pressure × volume = constant

$$\frac{\text{pressure}}{\text{temperature}} = \text{constant}$$

$$\frac{\text{volume}}{\text{temperature}} = \text{constant}$$

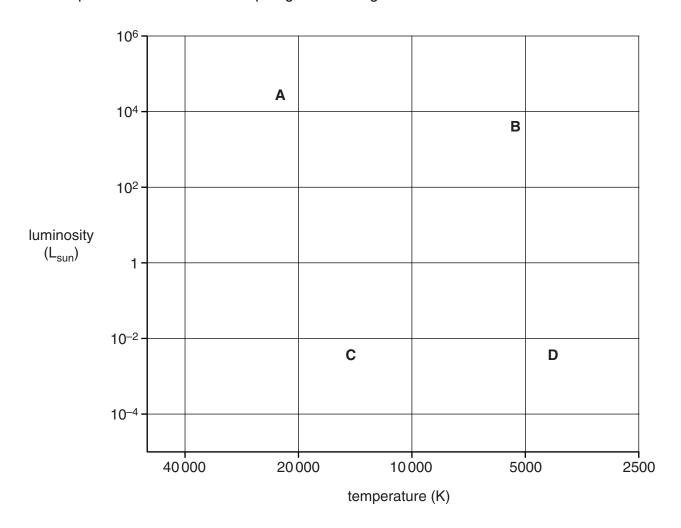

energy = mass \times [speed of light in a vacuum]²

Answer **all** the questions.

1	Muc	ch of	our knowledge ab	out stars comes	from the lig	ht we receive from	the stars.	
	(a)	(i)	It is very useful to	produce a spe	ctrum of the	light from a star.		
			Draw a labelled of light.	liagram to show	v how a prisi	m can produce a sp	pectrum from a bea	ım of
								[3]
		(ii)	What is the name	of the process	in the prism	that causes the sp	ectrum?	
			Put a ring aroun	d the correct ar	nswer.

2 This question is about the Hertzsprung-Russell diagram.

(a) The Hertzsprung-Russell diagram above shows the temperature and brightness of four objects A, B, C and D.

Which object on the Hertzsprung-Russell diagram will be:

[2]

(b) What type of object is the Hertzsprung-Russell diagram designed to show?

Put a (ring) around the correct answer.

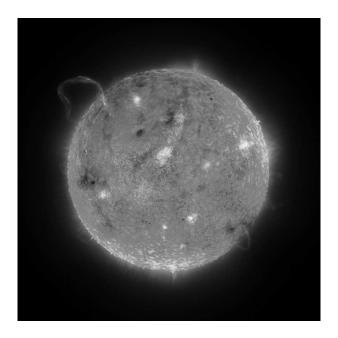

galaxies moons planets stars [1]

(c) (i) The Sun has a temperature of about 5000 K and luminosity of $1 L_{sun}$.

Plot and label the position of the Sun on the Hertzsprung-Russell diagram above. [2]

(ii)	The average temperature of the Earth is about	t 15°C.
	What is this temperature in kelvin (K)?	
	temperature	= K [2]
(iii)	The Earth can not be plotted on this Hertzspro Why not?	ung-Russell diagram.
		[1]
(d) A, C	C and D on the Hertzsprung-Russell diagram a	re stars.
Dra	w straight lines to connect the stars to the type	e of star.
	stars	type of star
		main sequence
	A and D	
μ	A and D	red giant
	•	supergiant
	С	
		white dwarf
		[2]

[Total: 10]

Describe the life of a star like the Sun, from its formation to its death.

The quality of written communication will be assessed in your answer.
[6]
 [-]

[Total: 6]

4 The table gives some information about possible sites for a new astronomical observatory.

Site	Height above sea level in m	Average cloudless nights per year	Distance to nearest town in km
W	5000	360	100
Х	1000	120	150
Υ	6000	270	50
Z	500	230	30

Which site would be the best for an astronomical observatory? By considering each site, explain and justify your choice.

The quality of written communication will be assessed in your answer.	
	[6]
	[Total: 6]

5		ecent years, scientists have observed things outside our solar system. se observations make them think it is more likely that life will be found outside our solar system.
	(a)	What have scientists observed and how do these observations make it more likely that life will be found outside the solar system?
	/l=\	[2]
	(b)	How many species of extraterrestrial life have scientists found? [1]
		[Total: 3]
		[
6	Dra	w a labelled diagram to explain a lunar eclipse.

[Total: 3]

7 In the late 1700s, the Titius-Bode Law was published.

The law was used for calculating the distance of the planets from the Sun. The distance from the Earth to the Sun is 1 AU. This is what the law says:

To find the distance in AU:

- take the sequence of numbers 0, 3, 6, 12, 24, 48, 96, ... (each number after the first two is double the previous number)
- add 4 to each number in the sequence
- divide each number by 10 to give the distance.

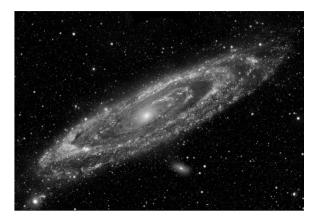

Titius-Bode distance calculation in AU	Planet	Actual distance from Sun in AU
(0+4)/10=0.4	Mercury	0.39
(3+4)/10=0.7	Venus	0.72
(6+4)/10=1.0	Earth	1.00
(12 + 4)/10 = 1.6	Mars	1.52
(48 + 4)/10 = 5.2	Jupiter	5.20
(96 + 4)/10 = 10	Saturn	9.54

(a)	-	gest why the Titius-Bode Law was only applied to the six planets out to Saturn in the first ance.
		[1]
(b)	Bod	le thought there should be a planet between Mars and Jupiter.
	(i)	Calculate the distance using the Titius-Bode Law.
		distance = AU [2]
	(ii)	In 1801, the astronomer Giuseppe Piazzi discovered a new (dwarf) planet, <i>Ceres</i> , at a distance of 2.77 AU from the Sun. Does this support the Titius-Bode Law? Explain why.
		[41]

,		find the planet.	
	Why is it important tha	t other astronomers obser	ve the new planet?
The t	table below gives the d	lata for other more recently	y discovered planets.
—			
	s-Bode calculation f distance in AU	Planet	Actual distance from Sun in AU
(192 -	+ 4)/10 = 19.6	Uranus	19.18
(384 -	+ 4)/10 = 38.8	Neptune	30.06
(768 -	+ 4)/10 = 77.2	Pluto	39.44

[Total: 10]

8 One of the most distant objects visible to the naked eye is the Andromeda galaxy.

Edwin Hubble first measured the distance to the Andromeda galaxy using Cepheid variables. He measured the distance as about 1 million light years. Modern measurements using Cepheid variables, give a distance of 2.5 million light years.

Telescopes in space have made it possible to make better measurements of parallax and of the brightness of stars.

Explain:

- how using space telescopes gives better measurements of parallax and brightness
- how this improves measurement of distance to Cepheid variables.

The quality of written communication will be assessed in your answer.

lan is a young scientist at university. He reads about some research in a peer reviewed scientific journal.			
(a)	Wh	at is meant by 'peer reviewed'?	
		[2]	
(b)		The research measured the speed of recession of a galaxy. Ian's supervisor asks him to reproduce the results.	
	(i)	lan looks up the distance to the galaxy in a reference book and then calculates the speed of recession for the galaxy using the Hubble constant. distance to galaxy = 2000 Mpc Hubble constant = 70 km/s per Mpc	
		Calculate the speed of recession of the galaxy.	
		speed of recession =km/s [2]	
	(ii)	lan's results agree with the published research. However lan's supervisor tells him that he has not reproduced the results. What is the problem with lan's method?
